- Fuzzy Sets
 - Basic Definitions and Results for Standard Operations
 - Algebraic Difference between Fuzzy and Crisp Sets

Observation:

Communication between people is not precise but somehow fuzzy and vague.

"If the water is too hot then add a little bit of cold water."

Despite these shortcomings in human language we are able

- to process fuzzy / uncertain information and
- to accomplish complex tasks!

Goal:

Development of formal framework to process fuzzy statements in computer.

Consider the statement:

"The water is hot."

Which temperature defines "hot"?

A single temperature $T = 100^{\circ} C$?

No! Rather, an interval of temperatures: $T \in [70, 120]$!

But who defines the limits of the intervals?

Some people regard temperatures > 60° C as hot, others already T > 50° C!

Idea: All people might agree that a temperature in the <u>set</u> [70, 120] defines a hot temperature!

If T = 65°C not all people regard this as hot. It does not belong to [70,120].

But it is hot to some degree.

Or: $T = 65^{\circ}C$ belongs to set of hot temperatures to some <u>degree!</u>

⇒ Can be the concept for capturing fuzziness! ⇒ Formalize this concept!

A map F: $X \to [0,1] \subset \mathbb{R}$ that assigns its *degree of membership* F(x) to each $x \in X$ is termed a **fuzzy set**.

Remark:

A fuzzy set F is actually a map F(x). Shorthand notation is simply F.

Same point of view possible for traditional ("crisp") sets:

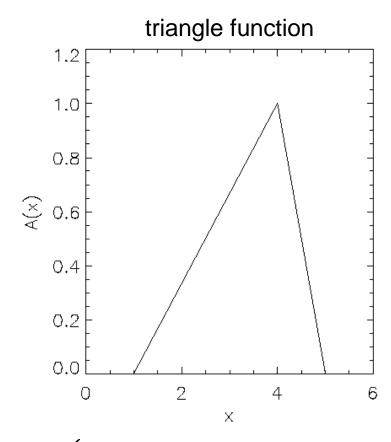

$$A(x):=\mathbf{1}_{[x\in A]}:=\mathbf{1}_A(x):=\left\{\begin{array}{ll} 1 & \text{, if } x\in A\\ 0 & \text{, if } x\notin A \end{array}\right.$$

characteristic / indicator function of (crisp) set A

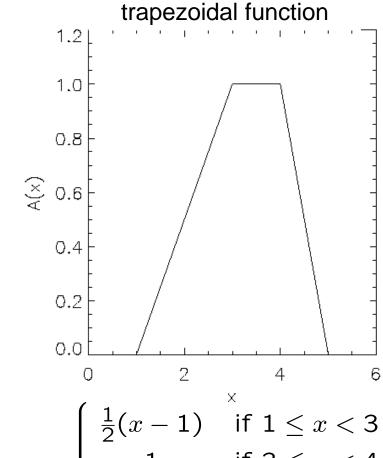

⇒ membership function interpreted as generalization of characteristic function

Fuzzy Sets: Membership Functions

Lecture 05

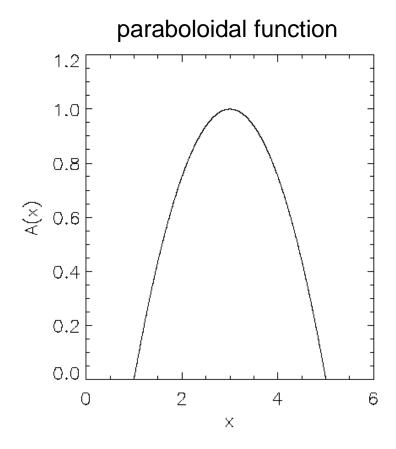

$$A(x) = \begin{cases} \frac{1}{3}(x-1) & \text{if } 1 \le x < 4\\ 5-x & \text{if } 4 \le x < 5\\ 0 & \text{otherwise} \end{cases}$$

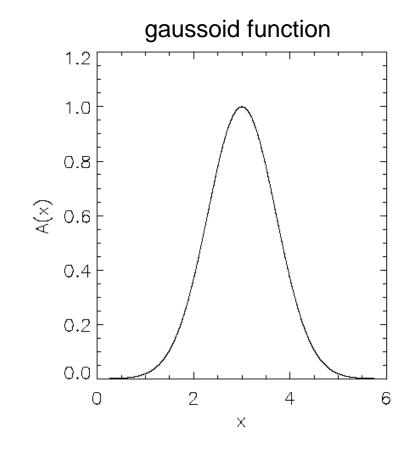

$$A(x) = \begin{cases} \frac{1}{3}(x-1) & \text{if } 1 \le x < 4 \\ 5-x & \text{if } 4 \le x < 5 \\ 0 & \text{otherwise} \end{cases} \qquad A(x) = \begin{cases} \frac{1}{2}(x-1) & \text{if } 1 \le x < 3 \\ 1 & \text{if } 3 \le x < 4 \\ 5-x & \text{if } 4 \le x < 5 \\ 0 & \text{otherwise} \end{cases}$$

Fuzzy Sets: Membership Functions

Lecture 05

$$A(x) = \begin{cases} -\frac{(x-1)(x-5)}{4} & \text{if } 1 \le x < 5\\ 0 & \text{otherwise} \end{cases}$$

$$A(x) = \exp\left(-\frac{(x-3)^2}{2}\right)$$

A fuzzy set F over the crisp set X is termed

- a) **empty** if F(x) = 0 for all $x \in X$,
- b) *universal* if F(x) = 1 for all $x \in X$.

Empty fuzzy set is denoted by \mathbb{O} . Universal set is denoted by \mathbb{U} .

Definition

Let A and B be fuzzy sets over the crisp set X.

- a) A and B are termed **equal**, denoted A = B, if A(x) = B(x) for all $x \in X$.
- b) A is a **subset** of B, denoted $A \subseteq B$, if $A(x) \le B(x)$ for all $x \in X$.
- c) A is a *strict subset* of B, denoted $A \subset B$, if $A \subseteq B$ and $\exists x \in X$: A(x) < B(x).

Remark: A strict subset is also called a proper subset.

Let A, B and C be fuzzy sets over the crisp set X. The following relations are valid:

- a) reflexivity : $A \subseteq A$.
- b) antisymmetry : $A \subseteq B$ and $B \subseteq A \Rightarrow A = B$.
- c) transitivity : $A \subseteq B$ and $B \subseteq C \Rightarrow A \subseteq C$.

Proof: (via reduction to definitions and exploiting operations on crisp sets)

ad a)
$$\forall x \in X$$
: $A(x) \leq A(x)$.

ad b)
$$\forall x \in X$$
: $A(x) \leq B(x)$ and $B(x) \leq A(x) \Rightarrow A(x) = B(x)$.

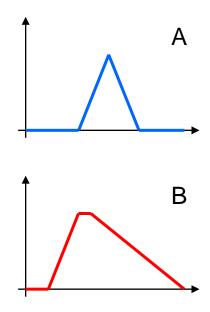

ad c)
$$\forall x \in X$$
: $A(x) \leq B(x)$ and $B(x) \leq C(x) \Rightarrow A(x) \leq C(x)$.

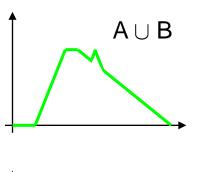

q.e.d.

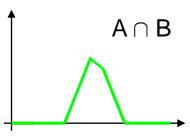

Remark: Same relations valid for crisp sets. No Surprise! Why?

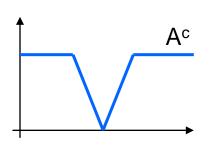

Let A and B be fuzzy sets over the crisp set X. The set C is the

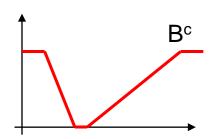

- a) *union* of A and B, denoted $C = A \cup B$, if $C(x) = max\{A(x), B(x)\}$ for all $x \in X$;
- b) *intersection* of A and B, denoted $C = A \cap B$, if $C(x) = min\{A(x), B(x)\}$ for all $x \in X$;
- c) **complement** of A, denoted $C = A^c$, if C(x) = 1 A(x) for all $x \in X$.

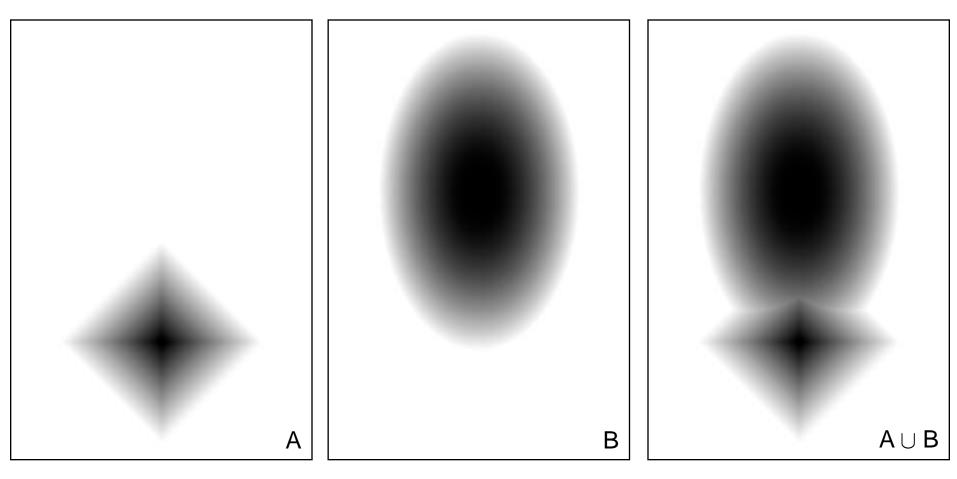

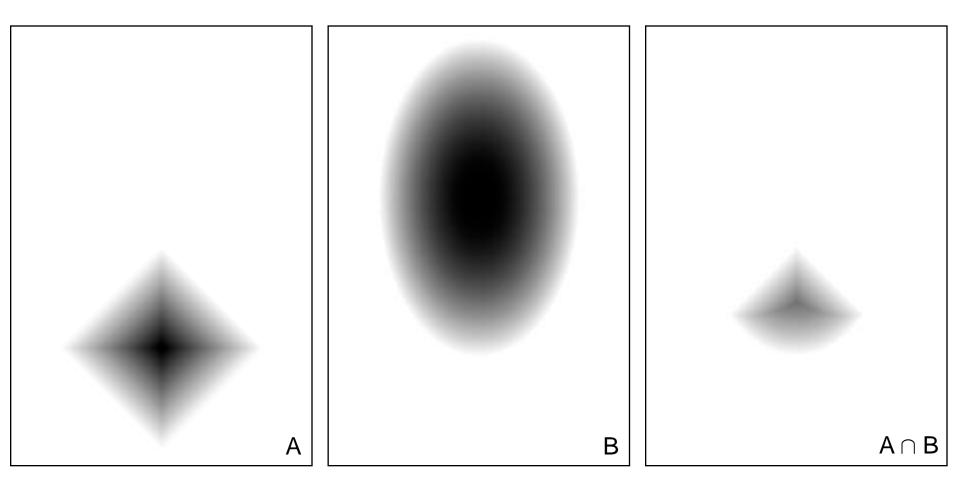

standard fuzzy union

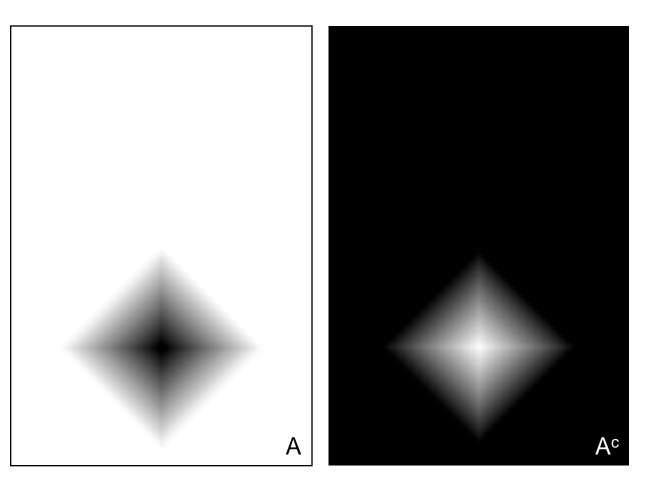

interpretation: membership = 0 is white, = 1 is black, in between is gray

standard fuzzy intersection

interpretation: membership = 0 is white, = 1 is black, in between is gray

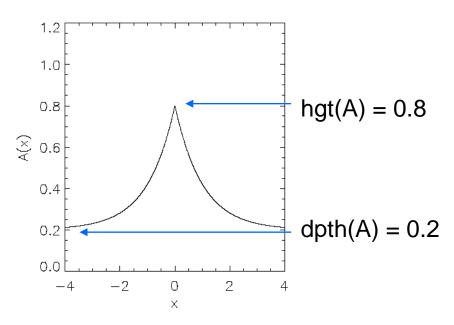

standard fuzzy complement

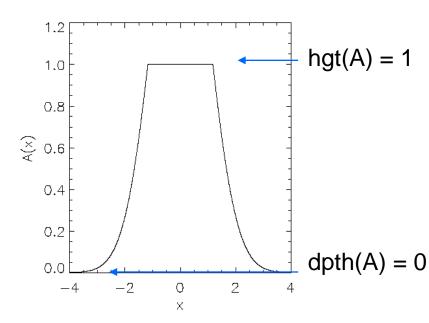

interpretation: membership = 0 is white, = 1 is black, in between is gray

The fuzzy set A over the crisp set X has

- a) **height** hgt(A) = sup{ $A(x) : x \in X$ },
- b) **depth** dpth(A) = inf $\{A(x) : x \in X\}$.

$$A(x) = \frac{1}{5} + \frac{3}{5} \exp(-|x|)$$

$$A(x) = \min\left\{1, 2 \exp\left(-\frac{x^2}{2}\right)\right\}$$

The fuzzy set A over the crisp set X is

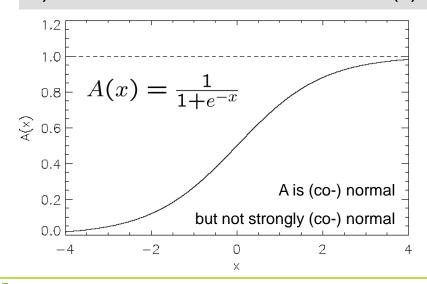

normal a)

- if hgt(A) = 1
- **strongly normal** if $\exists x \in X$: A(x) = 1
- co-normal

- if dpth(A) = 0
- **strongly co-normal** if $\exists x \in X$: A(x) = 0

subnormal

if 0 < A(x) < 1 for all $x \in X$.

Remark:

How to normalize a non-normal fuzzy set A?

$$A^*(x) = \frac{A(x)}{\mathsf{hgt}(A)}$$

The *cardinality* card(A) of a fuzzy set A over the crisp set X is

$$\operatorname{card}(A) := \left\{ \begin{array}{ll} \sum\limits_{x \in X} A(x) & \text{, if X countable} \\ \\ \int\limits_X A(x) \, dx & \text{, if } X \subseteq \mathbb{R}^{\mathsf{n}} \end{array} \right.$$

Examples:

a)
$$A(x) = q^x$$
 with $q \in (0,1)$, $x \in \mathbb{N}_0$ \Rightarrow card $(A) = \sum_{x \in X} A(x) = \sum_{x=0}^{\infty} q^x = \frac{1}{1-q} < \infty$

b) A(x) = 1/x with x
$$\in \mathbb{N}$$
 \Rightarrow card(A) = $\sum_{x \in X} A(x) = \sum_{x=1}^{\infty} \frac{1}{x} = \infty$

c) A(x) = exp(-|x|)
$$\Rightarrow \operatorname{card}(A) = \int_{x \in X}^{\infty} \operatorname{exp}(-|x|) = 2 < \infty$$

For fuzzy sets A, B and C over a crisp set X the standard union operation is

- a) **commutative** $: A \cup B = B \cup A$
- b) associative : $A \cup (B \cup C) = (A \cup B) \cup C$
- c) idempotent : $A \cup A = A$
- d) monotone : $A \subseteq B \Rightarrow (A \cup C) \subseteq (B \cup C)$.

Proof: (via reduction to definitions)

ad a)
$$A \cup B = \max \{ A(x), B(x) \} = \max \{ B(x), A(x) \} = B \cup A.$$

ad b)
$$A \cup (B \cup C) = \max \{ A(x), \max\{ B(x), C(x) \} \} = \max \{ A(x), B(x), C(x) \}$$

= $\max \{ \max\{ A(x), B(x) \}, C(x) \} = (A \cup B) \cup C.$

ad c)
$$A \cup A = \max \{ A(x), A(x) \} = A(x) = A$$
.

ad d) $A \cup C = \max \{ A(x), C(x) \} \le \max \{ B(x), C(x) \} = B \cup C \text{ since } A(x) \le B(x).$ q.e.d.

For fuzzy sets A, B and C over a crisp set X the standard intersection operation is

a) commutative : $A \cap B = B \cap A$

b) associative : $A \cap (B \cap C) = (A \cap B) \cap C$

c) idempotent : $A \cap A = A$

d) monotone : $A \subseteq B \Rightarrow (A \cap C) \subseteq (B \cap C)$.

Proof: (analogous to proof for standard union operation)

For fuzzy sets A, B and C over a crisp set X there are the distributive laws

- a) $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$
- b) $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$.

Proof:

ad a) max { A(x), min { B(x), C(x) } } =
$$\begin{cases} max \{ A(x), B(x) \} & \text{if } B(x) \le C(x) \\ max \{ A(x), C(x) \} & \text{otherwise} \end{cases}$$

If $B(x) \le C(x)$ then $\max \{ A(x), B(x) \} \le \max \{ A(x), C(x) \}$.

Otherwise $\max \{ A(x), C(x) \} \le \max \{ A(x), B(x) \}.$

- ⇒ result is always the smaller max-expression
- \Rightarrow result is min { max { A(x), B(x) }, max { A(x), C(x) } } = (A \cup B) \cap (A \cup C).

ad b) analogous.

Fuzzy Sets: Basic Results

Lecture 05

Theorem

If A is a fuzzy set over a crisp set X then

- a) $A \cup \mathbb{O} = A$
- b) $A \cup U = U$
- c) $A \cap \mathbb{O} = \mathbb{O}$
- d) $A \cap \mathbb{U} = A$.

Proof:

(via reduction to definitions)

ad a) $\max \{ A(x), 0 \} = A(x)$

ad b) max $\{A(x), 1\} = \mathbb{U}(x) \equiv 1$

ad c) min $\{A(x), 0\} = \mathbb{O}(x) \equiv 0$

ad d) min $\{ A(x), 1 \} = A(x)$.

Breakpoint:

So far we know that fuzzy sets with operations \cap and \cup are a <u>distributive lattice</u>.

If we can show the validity of

•
$$(A^c)^c = A$$

$$\bullet A \cup A^c = \mathbb{U}$$

• A
$$\cap$$
 A^c = \mathbb{O}

⇒ Fuzzy Sets would be Boolean Algebra! Is it true ?

If A is a fuzzy set over a crisp set X then

- a) $(A^{c})^{c} = A$
- b) $\frac{1}{2} \le (A \cup A^c)(x) < 1$ for $A(x) \in (0,1)$
- c) $0 < (A \cap A^c)(x) \le \frac{1}{2}$ for $A(x) \in (0,1)$

Remark:

Recall the identities

$$\min\{a,b\} = \frac{a+b-|a-b|}{2}$$

$$\max\{a,b\} = \frac{a+b+|a-b|}{2}$$

Proof:

ad a)
$$\forall x \in X$$
: $1 - (1 - A(x)) = A(x)$.

ad b) $\forall x \in X$: max $\{A(x), 1 - A(x)\} = \frac{1}{2} + |A(x) - \frac{1}{2}| \ge \frac{1}{2}$.

Value 1 only attainable for A(x) = 0 or A(x) = 1.

ad c) $\forall x \in X$: min $\{A(x), 1 - A(x)\} = \frac{1}{2} - |A(x) - \frac{1}{2}| \le \frac{1}{2}$.

Value 0 only attainable for A(x) = 0 or A(x) = 1.

q.e.d.

Conclusion:

Fuzzy sets with \cup and \cap are a distributive lattice.

But in general:

a) $A \cup A^c \neq \mathbb{U}$ b) $A \cap A^c \neq \mathbb{O}$ \Rightarrow Fuzzy sets with \cup and \cap are **not** a Boolean algebra!

Remarks:

The **law of excluded middle** does not hold! ad a)

("Everything must either be or not be!")

The law of noncontradiction does not hold! ad b)

("Nothing can both be and not be!")

Nonvalidity of these laws generate the desired fuzziness! \Rightarrow

but: Fuzzy sets still endowed with much algebraic structure (distributive lattice)!

If A and B are fuzzy sets over a crisp set X with standard union, intersection, and complement operations then **DeMorgan**'s laws are valid:

- a) $(A \cap B)^c = A^c \cup B^c$
- b) $(A \cup B)^c = A^c \cap B^c$

Proof: (via reduction to elementary identities)

ad a)
$$(A \cap B)^c(x) = 1 - \min \{ A(x), B(x) \} = \max \{ 1 - A(x), 1 - B(x) \} = A^c(x) \cup B^c(x)$$

ad b)
$$(A \cup B)^c(x) = 1 - \max \{ A(x), B(x) \} = \min \{ 1 - A(x), 1 - B(x) \} = A^c(x) \cap B^c(x)$$

q.e.d.

Question: Why restricting result above to "standard" operations?

Conjecture : Most likely there also exist "nonstandard" operations!
