How difficult is it

- (a) to find a separating hyperplane, provided it exists?
- (b) to decide, that there is no separating hyperplane?

Let B = P \cup { -x : x \in N } (only positive examples), w_i \in R , $\theta \in$ R , |B| = m

For every example $x_i \in B$ should hold:

 $x_{i1} W_1 + x_{i2} W_2 + ... + x_{in} W_n \ge \theta$ \rightarrow trivial solution $w_i = \theta = 0$ to be excluded!

Therefore additionally: $n \in R$

 $X_{i1} W_1 + X_{i2} W_2 + ... + X_{in} W_n - \theta - \eta \ge 0$
