### **Design of Evolutionary Algorithms**

Lecture 07

- every recombination results

- mutation of z may then lead

to any  $z^* \in \mathbb{Z}^n$  with positive probability in one step

in some  $z \in \mathbb{Z}^n$ 

ad 2) design guidelines for variation operators in practice

integer search space  $X = \mathbb{Z}^n$ 

- a) reachability
- b) unbiasedness
- c) control
- ad a) support of mutation should be  $\mathbb{Z}^n$
- ad b) need maximum entropy distribution over support  $\mathbb{Z}^n$
- ad c) control variability by parameter
  - → formulate as constraint of maximum entropy distribution

# **Design of Evolutionary Algorithms**

Lecture 07

ad 2) design guidelines for variation operators in practice

 $X = \mathbb{Z}^n$ 

**task:** find (symmetric) maximum entropy distribution over  $\mathbb{Z}$  with  $\mathbb{E}[|Z|] = \theta > 0$ 

⇒ need *analytic* solution of an ∞-dimensional, nonlinear optimization problem with constraints!

$$H(p) = -\sum_{k=-\infty}^{\infty} p_k \log p_k \quad \longrightarrow \quad \max!$$

technische universität

$$p_k = p_{-k} \quad \forall k \in \mathbb{Z}$$
 , (symmetry w.r.t. 0)

$$\sum_{k=-\infty}^{\infty} p_k = 1 , \qquad \qquad \text{(normalization)}$$

$$p_k = p_{-k} \quad \forall k \in \mathbb{Z}$$
 , (symmetry w.r.t. 0) 
$$\sum_{k=-\infty}^{\infty} p_k = 1 \; , \qquad \qquad \text{(normalization)}$$
 
$$\sum_{k=-\infty}^{\infty} |k| \, p_k = \theta \qquad \qquad \text{(control "spread")}$$

$$p_k \geq 0 \quad \forall k \in \mathbb{Z}$$
 . (nonnegativity)

### **Design of Evolutionary Algorithms**

Lecture 07

### result:

a random variable Z with support  $\ensuremath{\mathbb{Z}}$  and probability distribution

$$p_k := P\{Z = k\} = \frac{q}{2-q} (1-q)^{|k|}, k \in \mathbb{Z}, q \in (0,1)$$

symmetric w.r.t. 0, unimodal, spread manageable by q and has max. entropy

generation of pseudo random numbers:

$$Z = G_1 - G_2$$

where

$$U_i \sim U(0,1) \quad \Rightarrow \quad G_i = \left| \frac{\log(1 - U_i)}{\log(1 - q)} \right| \quad , \quad i = 1, 2.$$

stochastic independent!

# **Design of Evolutionary Algorithms**

Lecture 07

### How to control the spread?

We must be able to adapt  $q \in (0,1)$  for generating Z with variable  $E|Z| = \theta$ ! self-adaptation of q in open interval (0,1)?

 $\longrightarrow$  make mean step size E[|Z|] adjustable!

$$E[|Z|] = \sum_{k=-\infty}^{\infty} |k| p_k = \theta = \frac{2(1-q)}{q(2-q)} \Leftrightarrow q = 1 - \frac{\theta}{(1+\theta^2)^{1/2} + 1}$$

$$\in \mathbb{R}_+ \qquad \qquad \in (0,1)$$

 $\rightarrow \theta$  adjustable by mutative self adaptation

 $\rightarrow$  get q from  $\theta$ 

like mutative step size size control of  $\sigma$  in EA with search space  $\mathbb{R}^n$ !

# **Design of Evolutionary Algorithms**

Lecture 07

### **Mutative Step Size Control**

Individual  $(\mathbf{x}, \boldsymbol{\theta}) \in \mathbb{Z}^n \times \mathbb{R}_+$ 

First, mutate step size

 $\theta_{t+1} = \theta_t \cdot L$ 

Second, mutate parent  $Y = x + \theta_{t+1} \cdot Z$ 

Often: assure minimal step size ≥ 1

 $\theta_{t+1} = \max\{1, \theta_t \cdot L\}$ 

→ invented: Schwefel (1977) for real variables

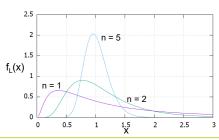

**Design of Evolutionary Algorithms** 

→ transferred: Rudolph (1994) for integer variables

where L =  $\exp(N)$  with N ~ N(0, 1/n)

log-normal distributed

 $P\{L > c\} = P\{L < 1/c\} \text{ for } c \ge 1$ 

G. Rudolph: Computational Intelligence • Winter Term 2022/23

technische universität dortmund

### Lecture 07

# n - dimensional generalization

$$P\{Z_i = k\} = \frac{q}{2-q} (1-q)^{|k|}$$

$$P\{Z_1 = k_1, Z_2 = k_2, \dots, Z_n = k_n\} = \prod_{i=1}^n P\{Z_i = k_i\} =$$

$$\left(\frac{q}{2-q}\right)^n \prod_{i=1}^n (1-q)^{|k_i|} = \left(\frac{q}{2-q}\right)^n (1-q)^{\sum_{i=1}^n |k_i|}$$

$$= \left(\frac{q}{2-q}\right)^n (1-q)^{\|k\|_1}.$$

- $\Rightarrow$  n-dimensional distribution is symmetric w.r.t.  $\ell_1$  norm!
- ⇒ all random vectors with same step length have same probability!

# Lecture 07

# How to control E[ $||Z||_1$ ]?

$$E[\|Z\|_1] = E\left[\sum_{i=1}^n |Z_i|\right] = \sum_{i=1}^n E[|Z_i|] = n \cdot E[|Z_1|]$$
 by def. linearity of E[·] identical distributions for Z<sub>i</sub>

$$n \cdot E[|Z_1|] = n \cdot \frac{2(1-q)}{q(2-q)} \quad \Leftrightarrow \quad q = 1 - \frac{\theta/n}{(1+(\theta/n)^2)^{1/2}+1}$$

$$= \theta \qquad \qquad \text{self-adaptation}$$

### **Design of Evolutionary Algorithms**

Lecture 07

# Algorithm:

individual  $(x,\theta) \in \mathbb{Z}^n \times \mathbb{R}_+$ 

:  $\theta^{(t+1)} = \theta^{(t)} \cdot \exp(N)$ .  $N \sim N(0, 1/n)$ . mutation

if  $\theta^{(t+1)} < 1$  then  $\theta_{t+1} = 1$ 

calculate new q for  $G_i$  from  $\theta_{t+1}$ 

 $\forall j = 1, \dots, n : X_j^{(t+1)} = X_j^{(t)} + (G_{1,j} - G_{2,j})$ 

recombination: discrete (uniform crossover)

:  $(\mu, \lambda)$ -selection selection

(Rudolph, PPSN 1994)

G. Rudolph: Computational Intelligence • Winter Term 2022/23

### **Excursion: Maximum Entropy Distributions** Lecture 07

### ad 2) design guidelines for variation operators in practice

continuous search space  $X = \mathbb{R}^n$ 

a) reachability → mutation distribution with unbounded support

b) unbiasedness → mutation distribution with maximum entropy

→ mutation distribution with parameters c) control

⇒ leads to CMA-ES!

Covariance Matrix **A**daptation

### **Design of Evolutionary Algorithms**

Lecture 07

**Example:**  $(1, \lambda)$ -EA with  $\lambda = 10$ ;  $f(x) = x'x \rightarrow min!$ ; n = 10

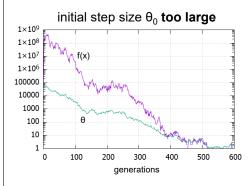

$$\mathbf{X}^{(0)} \in [100, 101]^n \cap \mathbb{Z}^n$$

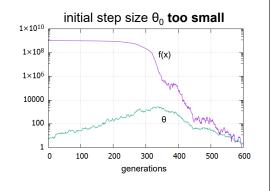

$$0 \in [100, 101]^n \cap \mathbb{Z}^n$$

$$\theta_0 = 50~000$$

$$X^{(0)} \in [10000, 10100]^n \cap \mathbb{Z}^n$$

$$\theta_0 = 5$$

Lecture 07

mutation: Y = X + Z

Z ~ N(0, C) multinormal distribution

maximum entropy distribution for support Rn, given expectation vector and covariance matrix

how should we choose covariance matrix C?

unless we have not learned something about the problem during search

⇒ don't prefer any direction!

■ technische universität

dortmund

 $\Rightarrow$  covariance matrix C = I<sub>n</sub> (unit matrix)

 $C = diag(s_1,...,s_n)$ 

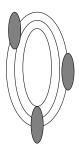

C orthogonal

### **Towards CMA-ES**

### Lecture 07

claim: mutations should be aligned to isolines of problem (Schwefel 1981)

if true then covariance matrix should be inverse of Hessian matrix!

$$\Rightarrow$$
 assume f(x)  $\approx \frac{1}{2} x^4 A x + b^4 x + c  $\Rightarrow H = A$$ 

$$Z \sim N(0, C)$$
 with density 
$$f_Z(x) = \frac{1}{(2\pi)^{n/2} |C|^{1/2}} \exp\left(-\frac{1}{2}x'C^{-1}x\right)$$

since then many proposals how to adapt the covariance matrix

 $\Rightarrow$  extreme case: use n+1 pairs (x, f(x)), apply multiple linear regression to obtain estimators for A, b, c invert estimated matrix A! OK, **but**: O(n<sup>6</sup>)! (Rudolph 1992)

G. Rudolph: Computational Intelligence • Winter Term 2022/23

# **Towards CMA-ES**

Lecture 07

 $Z = rQu, A = B'B, B = Q^{-1}$ 

$$f(x + rQu) = \frac{1}{2}(x + rQu)'A(x + rQu) + b'(x + rQu) + c$$

$$= \frac{1}{2}(x'Ax + 2rx'AQu + r^2u'Q'AQu) + b'x + rb'Qu + c$$

$$= f(x) + rx'AQu + rb'Qu + \frac{1}{2}r^2u'Q'AQu$$

$$= f(x) + r(Ax + b + \frac{r}{2}AQu)'Qu$$

$$= f(x) + r(\nabla f(x) + \frac{r}{2}AQu)'Qu$$

$$= f(x) + r\nabla f(x)'Qu + \frac{r^2}{2}u'Q'AQu$$

$$= f(x) + r\nabla f(x)'Qu + \frac{r^2}{2} \rightarrow \min!$$

if Qu were deterministic ...

 $\Rightarrow$  set Qu =  $-\nabla f(x)$ (direction of steepest descent)

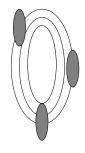

# technische universität

### **Towards CMA-ES**

Lecture 07

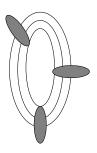

doubts: are equi-aligned isolines really optimal?

principal axis

should point into negative gradient direction!

(proof next slide)

most (effective) algorithms behave like this:

run roughly into negative gradient direction, sooner or later we approach longest main principal axis of Hessian,

now negative gradient direction coincidences with direction to optimum, which is parallel to longest main principal axis of Hessian, which is parallel to the longest main principal axis of the inverse covariance matrix

(Schwefel OK in this situation)

technische universität dortmund

G. Rudolph: Computational Intelligence • Winter Term 2022/23

### **Towards CMA-ES**

Lecture 07

### Apart from (inefficient) regression, how can we get matrix elements of Q?

 $C^{(k+1)}$  = update(  $C^{(k)}$ , Population<sup>(k)</sup> ) ⇒ iteratively:

 $C^{(k)}$  must be positive definite (p.d.) and symmetric for all  $k \ge 0$ , basic constraint:

otherwise Cholesky decomposition impossible: C = Q'Q

### Lemma

Let A and B be quadratic matrices and  $\alpha$ ,  $\beta > 0$ .

- a) A, B symmetric  $\Rightarrow \alpha A + \beta B$  symmetric.
- b) A positive definite and B positive semidefinite  $\Rightarrow \alpha A + \beta B$  positive definite

technische universität

ad a) 
$$C = \alpha A + \beta B$$
 symmetric, since  $c_{ii} = \alpha a_{ii} + \beta b_{ii} = \alpha a_{ii} + \beta b_{ii} = c_{ii}$ 

ad b) 
$$\forall x \in \mathbb{R}^n \setminus \{0\}$$
:  $x'(\alpha A + \beta B) x = \alpha x'Ax + \beta x'Bx > 0$ 

### **Towards CMA-ES**

Lecture 07

### **Theorem**

A quadratic matrix  $C^{(k)}$  is symmetric and positive definite for all  $k \ge 0$ , if it is built via the iterative formula  $C^{(k+1)} = \alpha_k C^{(k)} + \beta_k v_k v_k'$  where  $C^{(0)} = I_{n_k} v_k \ne 0$ ,  $\alpha_k > 0$  and liminf  $\beta_k > 0$ .

### **Proof:**

If  $v \neq 0$ , then matrix V = vv' is symmetric and positive semidefinite, since

- as per definition of the dyadic product  $v_{ij} = v_i \cdot v_j = v_i \cdot v_j = v_{ij}$  for all i, j and
- for all  $x \in \mathbb{R}^n$ :  $x'(vv') x = (x'v) \cdot (v'x) = (x'v)^2 \ge 0$ .

Thus, the sequence of matrices  $v_k v'_k$  is symmetric and p.s.d. for  $k \ge 0$ .

Owing to the previous lemma matrix C(k+1) is symmetric and p.d., if

 $C^{(k)}$  is symmetric as well as p.d. and matrix  $v_k v_k'$  is symmetric and p.s.d.

Since  $C^{(0)} = I_n$  symmetric and p.d. it follows that  $C^{(1)}$  is symmetric and p.d.

Repetition of these arguments leads to the statement of the theorem.

G. Rudolph: Computational Intelligence • Winter Term 2022/23

### CMA-ES

Lecture 07

State-of-the-art: CMA-EA (currently many variants)

→ many successful applications in practice

C, C++, Java Fortran, Python, Matlab, R, Scilab

### available in WWW:

- http://cma.gforge.inria.fr/cmaes\_sourcecode\_page.html
- http://image.diku.dk/shark/ (EAlib, C++)
- ...

### advice:

before designing your own new method or grabbing another method with some fancy name ... try CMA-ES – it is available in most software libraries and often does the job!

G. Rudolph: Computational Intelligence • Winter Term 2022/23

### CMA-ES Lecture 07

Idea: Don't estimate matrix C in each iteration! Instead, approximate <u>iteratively!</u>

(Hansen, Ostermeier et al. 1996ff.)

→ Covariance Matrix Adaptation Evolutionary Algorithm (CMA-EA)

Set initial covariance matrix to  $C^{(0)} = I_n$ 

$$C^{(t+1)} = (1-\eta) C^{(t)} + \eta \sum_{i=1}^{\mu} w_i (x_{i:\lambda} - m^{(t)}) (x_{i:\lambda} - m^{(t)})$$

$$η$$
: "learning rate"  $\in$  (0,1)  $w_i$ : weights; mostly  $1/μ$ 

$$m = \frac{1}{\mu} \sum_{i=1}^{\mu} x_{i:\lambda}$$
 mean of all selected parents

complexity: **O**(μn<sup>2</sup> + n<sup>3</sup>)

sorting: 
$$f(x_{1:\lambda}) \le f(x_{2:\lambda}) \le ... \le f(x_{\lambda:\lambda})$$

Caution: must use mean m(t) of "old" selected parents; not "new" mean m(t+1)!

⇒ Seeking covariance matrix of fictitious distribution pointing in gradient direction!
